Point Of Sales

Advanced Point of Sales (APOS) has been designed and developed for the retail industry. APOS is made up of a number of modules, each module is designed to provide specific functionality for the various types of retail situations. Modules may be purchased separately in accordance with individual business requirements.

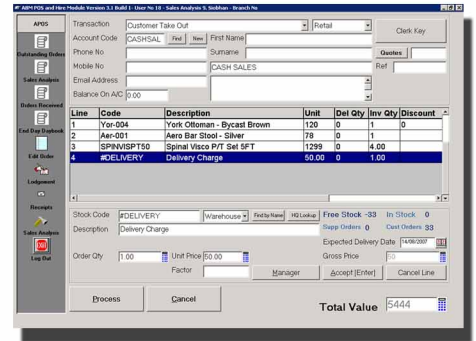

As APOS is 100% developed in Ireland. Our dedicated in-house programming team can amend the software to best suit your individual needs. Various different versions of APOS have been developed to suit different retail environments, such as tile and bathroom stores, carpet & furniture stores, DVD rental, tanning salons, etc.

System Overview

APOS is a powerful retail management program for ABM that runs under Microsoft Windows. It allows users to maintain control over all aspects of sales and inventory while presenting an easy and professional customer checkout.

ABM Integration

APOS seamlessly integrates with the Advanced Business Manager (ABM) financial systems to control all aspects of the back office needs. This integration with the financial system means there is no need for double-entry of information, as it allows point of sales transaction information to be posted to the sales & general ledgers automatically from the shop floor. Reports can be based on accurate live sales data.

Multi Branch Lookup

APOS allows you to check individual item stock levels online in another branch or warehouse.

Back to Back Ordering

APOS has a back to back ordering facility from the store to head office or warehouse. The store can produce a purchase order, which is then electronically sent to head office and updated as a sales order on the system.

BUSINESS SOLUTIONS

Features
